Advantages of All-Optical Network Switches

Overview

All-optical switches, devoid of power-hungry copper PHYs, generally have a lower power footprint and generate less heat, leading to reduced cooling costs and a greener operation. Positioned as high-performance network cores, optical switches often come equipped with advanced. This design enables end-to-end optical signal transmission, avoiding the conversion between electrical and optical signals at the switch port level. All this traffic is driven by the influx of high-bandwidth applications 3 which have caused an insatiable demand for increased data rates in optical long-haul communications.
