Bandwidth Aggregation Switch

Overview

By the mid-1990s, most network switch manufacturers had included aggregation capability as a proprietary extension to increase bandwidth between their switches. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help streamline traffic flow and reduce bottlenecks in enterprise or campus networks. Link aggregation increases total bandwidth beyond what a single connection could sustain, and provides redundancy where all but one of the physical links. Amounts or summary statistics are used in place of atomic data rows, which are often collected from several sources when data is aggregated.

Usage

By the mid-1990s, most network switch manufacturers had included aggregation capability as a proprietary extension to increase bandwidth between their switches. Each manufacturer developed its own method, which led to compatibility problems. The IEEE 802.3 working group took up a study group to create an interoperable link layer standard (i.e. encompassing the physical and data-link layers both) in a November 1997 meeting. The group quickly agreed to include an automatic configuration feature which

Aggregation Switch: Increasing the Priority of Special Traffic

Aggregation switches set up stacks to implement device-level backup and increase the interface density and forwarding bandwidth. Before deploying QoS, ensure that the campus network is connected. For
