Burying fiber optic cables on dirt roads

Overview

Fiber optic cables are typically buried between 12 and 36 inches (30–90 cm), depending on installation environment, soil conditions, and load requirements. In high-load areas such as roads or backbone routes, burial depth can reach 48 inches (120 cm) or more. However, simply hitting this depth isn't enough to guarantee your network survives. The following formulas may be used to determine general guidelines for installing Corning Optical Communications fiber optic cable; however, refer to the cable specifications simply double the minimum working bend radius. Estimate minimum burial depth (cover) for underground electrical, fiber, and low-voltage cable runs using a practical, code-aware ruleset. Underground cables are pulled in conduit that is buried underground, usually 1-1.
