How are plastic optical cables spliced

Overview

Fusion splicing is the most common and permanent method, where two fiber ends are fused together using heat, typically from an electric arc. This method provides the lowest signal loss and is ideal for long-term or high-performance applications. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. optical fibers are made comprised of exceedingly tiny strands of glass or plastic and these cables transfer information between two sites using completely optical. When done poorly, it can lead to significant signal degradation, network downtime, and costly rework.
