Power station relay protection measures include

Overview

Time-current characteristics, current setting, over current protective schemes, directional relay, protection of parallel feeders, protection of ring mains, Phase fault and earth fault protection, Combined earth fault and phase fault protective scheme . Protective relays and devices have been developed over 100 years ago to provide "lastline"of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. When a fault, such as an overcurrent, undervoltage, or short circuit, is detected, the relay triggers the circuit breaker to isolate the affected area. This comprehensive article delves into the key aspects of relay protection in HV/MV substations, including calculations, settings. Its main purpose is to safeguard electrical equipment like transformers, generators, and transmission lines from damage due to.
