Single-fiber optical module pairing issues

Overview

The fix is simple: treat the fiber link as a paired system and make sure both ends use the same optical spec—same speed, the same fiber type/wavelength (MMF vs. OM3). This document describes how to troubleshoot fiber optic interfaces by addressing some of the fiber optic module and cabling specifications. Whether you are dealing with a no link light, intermittent connectivity (link flapping), or a transceiver not detected error, the root cause is often not immediately obvious. If an FCS or CRC error occurs on a port, check whether the optical fiber is properly connected. Last 300 seconds input rate 0 bytes/sec, 0 packets/sec Last 300 seconds output rate 0. For example, a BiDi-A module using 1310 nm to transmit must pair with a BiDi-B module using 1550 nm. Let's break down the most frequent causes of SFP port issues and how to fix them.
