Single-mode optical module identification

Overview

To determine if your SFP (Small Form-factor Pluggable) module is single mode or multimode, you can look for specific markings or labels on the module itself. Typically, single mode SFP modules are labeled as "SM" or "single mode," while multimode modules may be labeled as "MM" or. Multimode (MMF) SFP modules involves a cross-referencing protocol of physical bail colors, EEPROM telemetry, and wavelength specifications. The distinction is important as it affects network performance, distance, and overall cost. They might look almost identical from the outside, but knowing the difference is important. The SMF refers to an SFP that is used with single-mode fibers, such as OS2 fiber.
