The maximum distance of long-distance optical fiber cables

Overview

Single-mode fiber optic cables are more suitable for long-distance, high-speed transmission than multimode fiber optics. For most applications, the maximum distance of a single-mode cable is around 160 kilometers. The maximum transmission distance varies significantly between fiber types, with single mode fiber offering substantially greater range than multi mode fiber alternatives. The maximum reach of a fiber optic cable is not a property of the cable alone — it is the result of a balance between the link attenuation and sensitivity of active equipment. A single OS2 cable can carry 1 Gbps over 100 km with suitable modules, or only 10 Gbps over 10 km with standard modules. Understanding the limits of this reach is fundamental to designing and deploying everything from transoceanic submarine cables to local.
