What is the normal power meter reading for a fiber optic transceiver in dB

Overview

An optical power meter is an instrument used to measure the absolute optical power or the relative loss of optical power passing through a section of optical fiber. Typical power levels measured by an optical power meter: Telecom transmitters: 0 to +10 dBm (1 to 10 milliwatts), Receivers: -30 dBm (1 microwatt) DWDM systems with fiber amplifiers: +10 to +20 dBm (10 to 100 milliwatts), Receivers: -20 to -30 dBm (1-10 microwatt) Data links and LANs: 0 to -10 dBm. The basic process is straightforward: turn the meter on, set it to the correct wavelength, clean your connectors, plug in, and read the. The standard unit for measuring this optical power is the decibel-milliwatt, or dBm.
