What to do if the wireless network is hidden on an epon device

Overview

Select Network & Internet > Internet and turn on "Wi-Fi" if it isn't already. While your network is probably one broadcasting an ID that you set up for yourself, you may see a hidden network in the list of available connections for your Wi-Fi router one day. A hidden network, also known as a non-broadcasting network or a stealth network, is a wireless network that doesn't broadcast its name (SSID) to the surrounding area. The hidden wifi ssid is one of the security mechanisms implemented by Wifi networks by hiding their name,, since a client device can only connect to a Wi-Fi network with a known SSID. Sometimes, these networks are hidden because they serve a very special purpose, like securing sensitive data in corporate environments or managing smart home devices discreetly, but most hidden networks are invisible as an extra security measure.
